

Data Analytics in Accounting: Visualizing Corporate Income Inequality

Seungjae Shin

Kevin Ennis

Mississippi State University, Meridian, kennis@meridian.msstate.edu

Abstract

Accounting courses increasingly require students to learn data analytics skills and extract insights from business data. The issue of corporate income inequality (the growing gap between the most- and least-profitable companies) has become relevant in discussions of global economic issues. This project has students use data analytic software tools to gain insight into corporate income inequality by extracting and analyzing accounting data. Students learn to clean, merge, and manipulate financial statement data sets to identify corporate income inequality through visualizations. Students' responses to the post-project questionnaire show that the project provided a positive learning experience and increased their academic performance.

Keywords

Accounting information systems, data analytics, corporate income inequality, data visualization, Excel, Tableau

© 2021 AIS Educator Association

This project, included in the Appendix, guides accounting students as they conduct an exploratory analysis of corporate income inequality, a significant global economic issue. Students first clean, merge, and analyze accounting data sets. Then, they use those data sets to identify the economic issue through data visualizations. The data used include the financial statements of U.S. publicly traded S&P 500 companies. The example we present here includes financial statements from 2001 through 2015. Students use MS Excel and Tableau to identify overall income inequality and to drill down to an industry-level analysis of two sectors, manufacturing and retail trade.

Prior Literature and Motivation for the Project

AIS education aims to help students understand how information technology can help them collect and analyze accounting data to support management decision-making. Thus, using current business software tools helps accounting students prepare for their careers (Lee, Kerler, and Ivancevich, 2018). The AAA-AICPA Pathways Commission (2015) identified accounting students' top three most-needed technologies: electronic spreadsheets, business intelligence and analytics, and database management.

Data Analytics: Professional Standards and Academic Literature

Accounting Accreditation Standard A5, issued by the Association to Advance Collegiate Schools of Business (AACSB International, 2018), states that data analytics and relevant information technology skills should be included in accounting curricula. The CPA Evolution initiative (Tish & Reeb, 2019) emphasizes the importance of data management and analytics as a core area of knowledge expected in newly licensed professional accountants, with three of its five guiding principles mentioning specific types of technology expertise, including data analytics, robotics and artificial intelligence (Coffey, 2019).

Data Analytics: Professional Literature

Tschakert et al. (2016) exhort practicing CPAs to increase their use of data analytics tools in auditing, financial planning, and analysis. Murphy and Tysiac (2015) argue that accountants are using data analytics tools and improved information technologies to replace traditional audit sampling with continuous testing of data populations. Ovaska-Few (2017) predicts that accounting graduates with data analytics skills will be in high demand but notes that teaching resources for those skills are limited, leading to concerns that accounting curricula today do not provide needed data analytics skills. Hart (2018) and Zhang (2019) provide teaching resources for data analytics in accounting. Hart (2018) notes that large accounting firms now offer data analytics resources to educators. Zhang (2019) argues the urgency of integrating data analytics tools, such as ACL, Alteryx, Excel, IDEA, PowerBI, and Tableau, into the accounting curriculum.

Income Inequality

Income inequality is an income distribution gap between two identifiable groups of people or households (Faello et al., 2018). Furman and Orszag (2015), summarized in Ip (2015), examined firm-level income inequality and found that employees of firms with super-normal returns on capital (ROC) shared in those returns, which increased individual income inequality. Specifically, Ip (2015) described return on capital (ROC) trends for non-financial S&P 500 companies from the 1960s to the 2010s and found the gap in ROC between the 90th and 25th percentiles had been stable from the 1960s through the 1980s, but widened during the 1990s and grew substantially in the first decade of the 2000s.

Project Overview

This section provides an overview of the critical elements of the project. We describe the learning objectives, what knowledge and skills students must have to undertake the project (prerequisites), and discuss issues related to acquiring the data needed. We also note the software licenses required to undertake the project.

Learning Objectives

Our review of the professional and academic literature on data analytics in accounting and the critical global economic issue of corporate income inequality leads us to set five learning objectives for this project. Upon completion of the project, students should be able to do the following:

- 1. Process (explore/clean/extract) an existing accounting data set
- 2. Use appropriate software tools, such as MS Excel and Tableau, to transform accounting data into useful information
- 3. Perform drill-down analysis to find more detailed information
- 4. Present outputs using visualization software
- 5. Describe the advantages and disadvantages of using various analytics software, such as MS Excel and Tableau

Prerequisites

This case requires that students know how to read financial statements and perform fundamental ratio analysis. Most business students will learn these skills in an introductory financial accounting course. Accounting students will often have this knowledge reinforced in subsequent intermediate financial accounting and auditing courses.

Students will also need basic knowledge of MS Excel, how its basic and intermediate functions (such as VLOOKUP, COUNTIF, and LEFT) work, and how to filter data in the software. Business students often learn these skills in an introductory, lower-division, electronic spreadsheets course.

Basic Tableau skills (such as converting data types, filtering data, creating hierarchy measures, creating calculated fields, and creating various charts) are also prerequisites for undertaking the project. Although many business schools offer training in these skills, most do not. We used the Tableau (2018) training site, which provides free tutorial videos for the skills needed to complete the project.

Data and Software License Sources

We obtained annual financial statements for U.S. publicly traded companies from Compustat, which we accessed through the Wharton Research Data Services (WRDS) interface and downloaded to MS Excel. For adopters at schools without WRDS access, an alternative free source of the most recent five years of historical financial statements is Morningstar.com. Adopters can work with their institution's business librarian to identify other sources of recent financial statements.

Microsoft Excel is widely available to university students at low or no cost through school licensing programs or the Microsoft Education (2022) Web site. Tableau (2022) provides free, limited-term academic student licenses. We created this project using the MS Excel 2016 and Tableau 2019.2 versions.

Efficacy

We have used the project in undergraduate accounting information systems courses and graduate management information systems and supply chain management courses over two years. These courses have a data analytics component and include using MS Excel and Tableau software. To learn more about the project's efficacy, we surveyed participating students in compliance with the rules of the relevant institutional review board. We first asked students to estimate their pre-project MS Excel and Tableau skill levels and rate themselves on a five-point scale (1, no experience; 2, beginner; 3, intermediate; 4, advanced; 5, expert). We report their responses in Table 1.

Table 1

I UDIC I			
Pre-project Students	' Self-assessed	Software	Skill Levels ^a

Software	Undergraduate	Students $(n = 20)$	Graduate Students (n = 57)			
	М	SD	М	SD		
MS Excel	2.65	0.xx	3.12	0.73		
Tableau	1.05	0.xx	1.56	0.85		

^aFive-point scale:1, no experience; 2, beginner; 3, intermediate; 4, advanced; 5, expert

Students reported having more expertise in MS Excel than Tableau, which is what we expected. Most of the students had never used Tableau before.

We also asked participating students to rate four statements about their experience using the software and their reaction to doing the project. We asked them to use a five-point scale (1, not at all; 2, slightly; 3, somewhat; 4, very; 5, extremely) to indicate their level of agreement with the statements, as summarized in Table 2.

Statements	Undergi	raduate	Graduate		
	Students	(n = 20)	Students $(n = 57)$		
	М	SD	М	SD	
Using Tableau helped me understand data analytics better	4.15	1.04	3.98	0.86	
The project was interesting	3.60	0.82	3.77	0.66	
The project was difficult	3.00	0.97	2.58	0.89	
The project was a positive learning experience	4.05	1.00	4.11	0.70	

Table 2

Ct. Janta	, ,, ,,		C4	-1	Г			D
Siudenis	Agreemeni	wiin	Sialements	about the	Ir Ex	perience	wiin ine	Project

^aFive-point scale:1, not at all; 2, slightly; 3, somewhat; 4, very; 5, extremely

The overall perceptions about this case project (that it was interesting, helpful, and a positive learning experience) were encouraging. Responses from graduate students were higher than those from undergraduate students, except for their perceptions of the degree of difficulty. Because we created this case to demonstrate the use of software tools in data analytics rather than to compare one tool to another, we did not compare student performance with a pre-test and post-test.

Course grades (of which the project grade was ten percent) for the 77 students who completed the survey included 25 As, 46 Bs, and 6 Cs. Student assessment of a "positive learning experience" has a statistically significant relationship (correlation coefficient of 0.265, p = 0.02) with students' final grades when we compare students earning As with those earning other grades (Bs or Cs).

Conclusion

Lawson (2019) finds that managers increasingly rely on accounting teams to provide strategic data analyses; thus, a shortage of accountants with those skills is an obstacle to getting good strategy support. Therefore, data analytics education in the accounting curriculum is critical. This project helps students use analytics software tools (MS Excel and Tableau) to extract, clean, and analyze useful financial statement data information.

Appendix

Data Analytics Project: Corporate Income Inequality

Project Setting

A *Wall Street Journal* (WSJ) article related to global economic issues, "Behind Rising Inequality: More Unequal Companies," was published on November 4, 2015. The author compared trends in return on capital (ROC) of non-financial companies in the S&P 500 since the 1960s to explore possible corporate income inequality, defined as the growing gap between the most- and least-profitable companies. The results indicate a gap, between the ROC of companies in the top 90% and the ROC of the rest of the S&P 500 companies. The gap started to surge in the 1990s and continues to grow substantially into the 21st century.

Further analysis of this data by Furman and Orszag (2018) suggests that productivity growth has been uneven among economic sectors. For example, the ROC of the top 10% of publicly traded non-financial firms was 20% in the 1980s and 100% or more in the 2010s, indicating that the ROC of the top 10% companies has risen roughly five times over the past three decades. Furman and Orszag (2018) identified two industry sectors, information technology and health care, as contributing the most to income inequality.

Data Description

In this project, you will analyze the annual financial statements for U.S. publicly traded companies from 2001 through 2015. As the WSJ article suggested, the data set excludes the financial industry, using Standard Industrial Classification (SIC) codes between 6000 and 6799, because the ROC data in the financial industry is considerably scarce. There are two worksheets in the student data Excel file: 'Data' and 'S&P500'. The 'Data' worksheet has financial statement data from 2001 through 2015 and the 'S&P500' worksheet has ticker symbols (column A) and company names (column B), which belong to S&P 500 index. The S&P 500 index is a stock market index, where the 505 common stocks are issued by the 500 largest capitalized companies listed in the U.S. stock markets, such as the NYSE and NASDAQ. The number of records in the 'Data' worksheet is 108,156, including header information, and that of 'S&P500' is 505, without header information. Table 1 shows 12 data items collected from the annual financial statements.

Project Instructions

Part 1. Understanding the issues about income inequality

Please read the article, Behind rising inequality: More unequal companies, published on November 4, 2015 (<u>https://www.wsj.com/articles/behind-rising-inequality-more-unequal-companies-1446665769</u>). If that article is not available, the following are alternatives:

Orszag, P. (2015). People are not unequal; companies are. <u>https://www.brookings.edu/opinions/people-are-not-unequal-companies-are/</u>

Frick, W. (2016). Corporate inequality is the defining fact of business today. <u>https://hbr.org/2016/05/corporate-inequality-is-the-defining-fact-of-business-today</u>

Part 2. Processing the data set with Excel

Your instructor will provide the source data set (Income-Inequality-Student-Data.xlsx), which includes two worksheets of 'data' and 'S&P500'. In this part, students learn the data processing technique from raw data to organized data, such as data verification, data cleaning, merging & sorting, to readying for a further data analysis. Figure 1 & 2 show the first several lines of data in each worksheet. In addition to the two worksheets, there are several blank worksheets with tab names of 'Count', 'Data-S&P500', 'S&P500-Only', 'S&P500-Not-Null', 'S&P-500-Sector' and 'Sector' (Figure 3) At the end of this project, students need to add three additional worksheets with tab names of 'ROC-Export', 'ROC-Sector-Export' and 'Memo'. Table 2 explains each Excel worksheet.

Table 2

Description of Excel Worksheets

Name of Worksheet	Data Description in Worksheet
[1] Data	Source data for financial statement items
[2] Count	Summarized table for count of records by year
[3] S&P500	Company list of S&P500 Index
[4] Data-S&P500	Source data with 'S&P500' field
[5] S&P500-Only	'Data-S&P500' data without Non-S&P500 companies
[6] S&P500-Not-Null	'S&P500-Only' data without blank cells
[7] S&P500-Sector	'S&P500-Not-Null' with 'Sector' field
[8] Sector	Summarized table for count of records by sector

Step 1: Summarize the count of records by year

Q1 How many records in each year from 2001 through 2015 respectively are in the 'Data' worksheet? Summarize the count of records by year on 'Count' worksheet.

Once you open the data file ('income-inequality-student-data.xlsx'), make sure the data set is sorted by FY. Count the number of data records in the 'Data' worksheet using the 'countif()' function. Save the output in 'Count' worksheet (Figure 4).

Figure 4

Count worksheet

- 11	A	8	c	D	E	F	G	н	14	1	к	4	M	N	0	p
3	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	total
2		-		1		3 2		1						1		1
3			1									1				1
1.14		Data	Count	58P500	Data-58	9P500	58/P500-Oni	y S&P	500 Not Nu	il Socto	or 5695	100 Sector	🕣	4		

Q2 What is the trend of number of data from 2001 through 2015? Is it a pattern of increasing, decreasing, or constant? Select the data you counted in the 'Count' worksheet and insert a bar chart with a trend line.

Step 2: Delete records that do not correspond to S&P500 companies, are duplicates or are null records.

Copy all data in the worksheet 'Data' and paste them in 'Data-S&P500' worksheet. Add a new column, 'S&P500' (column M), using the 'vlookup()' function. The 'vlookup()' function compares the TS (ticker symbol) of 'Data' worksheet (Figure 1) with ticker symbol column (no column header) in the 'S&P500' worksheet (Figure 2). If a value of TS in the 'Data' worksheet matches with of the value in the column of ticker symbol (column A) in the 'Data-S&P500' worksheet, put a value of TS in the column N. And also, using the 'iferror()' function together with 'vlookup()' function, if no matching of ticker symbol, type '0' in the cell (Figure 5).

Figure 5

S&P500 column in 'Data-S&P500' worksheet

Q3 How many '0' value / non-zero value are in the column M (S&P500) of the 'Data-S&P500' worksheet. Use a countif() function to find the number of '0' value and non-zero values in the column M.

Select all data using Excel short cut "Ctrl+A" in the worksheet 'Data-S&P500' and make a table using 'Format as Table' button in the 'Home' menu ribbon / 'Styles' group (Figure 6) Click the drop-down arrow in column M (S&P500) and unselect "0" (Figure 7) Copy and paste the filtered records into a new worksheet with a name of 'S&P500-Only'. Make sure that you select a paste option of 'Values' in applying 'paste' command (Figure 8)

Paste option: 'Values'

- Q4 How many data records are in the worksheet 'S&P500-Only' with the header line?
- Q5 Can you find empty cells? Which data field has empty cells? Click drop-down arrow of each column header and unselect 'blanks' option (Figure 9).

Figure 9

Copy and paste remaining data into a new worksheet named 'S&P500-Not-Null' (Figure 10) Make sure to select 'Values' option in applying 'paste' command (Figure 8).

Figure 10

'S&P500 Not Null' worksheet

Q6 How many data records in the worksheet 'S&P500-Not-Null' including header?

Q7 Can you find any duplicate data records in 'S&P500-Not-Null' worksheet?

Select the following menu path to find duplicate data: 'Data' menu ribbon > 'Data Tools' group > 'Remove Duplicate' button (Figure 11).

Figure 11

'Remove Duplicates' button and pop-up

	Remove Dupl	licates ?
vot 🛛 🖞 Tell me what you want to do	To delete duplicate values, select one or more	columns that contain duplicates.

Step 3: Classify record into industry sector using NAICS codes.

Select and copy column A through column L of 'S&P500-Not-Null' worksheet and paste it to 'S&P500-Sector' worksheet. In the column L of 'S&P500-Sector' worksheet, there are NAICS (North America Industry Classification System) codes. These codes are composed of 6 digits. The first two digits represent an industry sector.

Q8 Are there any code whose number is less than 6 digits in the column L (NAICS) of 'S&P500-Sector' worksheet? The NAICS column is the number data type and the minimum number with 6 digit integer number is 100,000. Count the number of NACIS codes using 'countif()' function. Even if the NAICS code should be a 6-digit number, some of NAICS code have less than 6 digits. Add a new column 'Sector' (column M) using a function of left() with the first two digits of the NAICS codes (Figure 12).

Figure 12

Sector column

- A - 3	A	8	c	D	E	F	G	н	1	1	ĸ	4	M

Sector worksheet

- **Q9** How many number of data in each sector in the worksheet 'S&P500-Sector'? Put your numbers in the Column C (No. of Record) of the 'Sector' worksheet using a 'countif()' function.
- Q10 Can you find any finance sector record in 'Sector' worksheet? The sector code 52, finance and insurance, is not supposed to be in 'S&P500-Sector' worksheet because the finance industry data should be excluded in the original data set. If 'Yes', what is the ticker symbol for that company?
- Q11 Sort the records in 'S&P500-Sector' worksheet by 'Sector' column (M) with ascending order. Delete the records with a sector code 52 in the 'S&P500-Sector' worksheet. How many records remain in the 'S&P500-Sector' worksheet including column header after deletion?
- **Q12** Do you have any record in the sector number 99? The sector code 99 is not in the NAICS code list. (Table 3) If 'Yes', what are ticker symbols for those companies? Even if the code 99 is out of range according to the Table 3, we keep it for further analysis.

Now you have a clean, organized data set ('S&P500-Sector') to upload to Tableau for further analysis. Make sure that there is no data after the last record, row number 4862 (Figure 15).

Figure 15

The Last Part of 'S&P500-Sector' Worksheet

Part 3. Visualization with Tableau

In Part 3, you will learn how to analyze the data to get useful information and how to present output as a form of chart.

Step 1: Upload Excel data to Tableau

Click "Microsoft Excel" under the connect tab and import the 'Income-Inequality-Student-Data.xlsx' Excel file to Tableau. In the data source page, drag 'S&P500 Sector' worksheet from the left pane to canvas which is located at the upper part of data source page (Figure 16).

Figure 16

Uploading Excel file to Tableau

Step 2: Check data types of each data field

Select 'Sheet 1' worksheet. Your data fields are grouped into two areas: 'Dimensions' and 'Measures'. The 'Dimensions' area contain qualitative values to categorize and the 'Measures' area contain quantitative values which can be aggregated (Figure 17).

Figure 17

Dimensions and measures

** * 7 60	4 11	100	<u>+</u>	Car (11)	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Abc Measure Names		T Automatic 🔹								
Measures # AT		Color	Ø Size	Text Drop						
# CEQ # DT # DVT		oto Detail			field hare	Drop field here				
# GDWL # NAICS # NI										

Drag 'SEC' and 'NAICS' fields from the Measures area to the Dimensions area. The 'SEC' field is a number symbol for the U.S. stock market exchanges and the 'NAICS' is an industry classification code. Even if 'SEC' and 'NAICS' fields show numeric data, the fields should be classified as non-numeric, categorical data. Change data type of 'SEC' and 'NACIS' from number to string (Figure 18).

Figure 18

Tableau data fields in dimensions and measures

Tableau has four data types: 'String', 'Number', 'Boolean' and 'Date'. Can you find any field in the Dimensions area with an inappropriate data type? Which field should be a 'Date' type? To change a field's data type, right-click the FY field and choose "Change Data Type' menu and choose is 'Date' type (Figure 19).

Figure 19

Change data type

Dimensions Abc CN	ד מ ≣	Filters	ROC
🛱 FY		Measure Names	1
# SEC # Sector		Add to Sheet Show Filter	0.35
Abc TS Abc <i>Measure Names</i>		Duplicate Rename Hide	0.30

# DVT # GDWL		Group by	 Date & Time Date
# Naics		Hierarchy	String
# NI # Revt		Replace References	Boolean
⊧# ROC		Describe	U.T.

Q13 Check the total number of record and see whether it is the same as the total number of records in 'S&P500-Sector' Excel worksheet. Summarize the count of records by year as you did in the Q1.

Drag 'Number of Records' in the measures area to 'Columns Shelf'. Right click the blue bar and select 'Mark Label' and 'Always Show' (Figure 20) The total number of records is 4,861 (without field header). Rename the worksheet as 'Count'.

Figure 20

Number of records

Cour	nt											
D	500	1000	1500		Select All		Г	3000	3500	4000	4500	5000

2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012		ALC: NOT THE REAL PROPERTY OF
216	295	311	321	324	327	332	334	338	341	345	346		

Now you can see a table summarized by year. Click 'Show Me' one more time and then the chart options will disappear. Click the 'New Worksheet' icon under the bottom of Tableau workbook and rename it as 'ROC'.

Step 3: Create an ROC field, ROC percentile fields and ROC-Gap field

ROC is a ratio indicating how effective a firm is at running invested capital into profits. Profit in the ROC ratio can be net income (NI) or net operating income (NOP). The general equation for ROC is known as (NI - DVT) / (DT + Equity). According to the WSJ article, the ROC in this project is calculated using invested capital without GDWL. Therefore, the ROC formula here is (NI-DVT) / (DT+CEQ-GDWL). Right-click on the white space in Measures area and select 'Create Calculated Field ...' (Figure 23) and type the ROC formula.

33

Figure 23

Create calculated field

	Create Calculated Field
	Create Parameter
	Create Folder (use group by folder)
	Group by Folder
•	Group by Data Source Table
•	Sort by Name
	Sort by Data Source Order
	Hide All Unused Fields
	Show Hidden Fields

Make sure to use brackets '[]' around data fields (Figure 24).

Figure 24

ROC formula showing use of brackets

Mea	asures	000	
=	AT	ROC	^
#	CEQ	Solo - Contra - California - Ca	
#	DT	((N1]-(DA1]) \ ([D1]+[CFO]-(GCM7])	
#	DVT		
=	GDWL		
	NI		
	Revt		
-44	ROC		
	Number of Records		
	Measure Values		
		The calculation is valid.	Jooly OK

In the ascending ordered data set, 90 percentile means a specific number where 90 percentage of data fall below that number. You will now create several more calculated fields: ROC90%, ROC75%, ROC50%, ROC25%, and ROC-Gap, which are the 90%, 75%, 50% and 25% numbers in the ordered ROC values (the ROC-Gap field is 'ROC 90% - ROC 25%'). Use the same method you used to calculate the ROC field. 'Percentile' is a function to return a value which the target percent of field, i.e. percentile ([ROC], .9) returns a value of 90% of ROC. The following is a list of formulas for the above five new calculated fields (Figure 25) Once you create the five new fields, you can see them in the Measures area.

Figure 25

ROCx% and ROC-gap fields

Step 4: Visualize ROC percentiles and ROC-Gap.

Q14 What is the pattern of ROC90%, ROC75%, ROC50%, ROC25% from 2001 through 2015? Increasing, decreasing, or combined of both?

Click 'New Worksheet' icon and drag 'FY' field to 'Columns Shelf' and the four ROC percentiles to 'Rows Shelf'. Click 'Show Me' and choose the 'Side-by-Side Bars' chart and click the drop-down arrow of fit icon in the tool bar and choose 'Entire View' (Figure 26).

Figure 26

Show me and side-by-side bars

· 15 1	1. IE	1.	0 - 33	4	Entire Vie	W	830 - T	F 40							show Me
III Columns		Measure	(FT) Values		leasure No	inters.							10 200 200 - 10 - 10 - 10 - 10 - 10 - 10 - 10 - 10

0.35							Ĩ						- 10	000	00 90 00 80
0.30											-		~~	52	~~

Drag 'Measure Names' on the 'Color' button in 'Marks' card (Figure 27). Right-click on the tab of the worksheet and rename it as 'ROC'.

Figure 27

Color in marks card and legend

ool Ba	r	•	Measure Names
Color	0 Size	T Label	ROC25%
ooo Detail	Tooltip		ROC75%

Q15 What is the pattern of ROC-Gap from 2001 through 2015, Increasing, decreasing, or ups and downs? Is it the same pattern as the WSJ article demonstrated? Which year has the largest gap? What would be a reason for the largest gap year?

Drag 'FY' field to 'Column Shelf' and ROC-Gap to 'Rows Shelf'. Click 'Show Me' and choose the 'Lines' chart (Figure 28).

35

Add a trend line using '(Polynomial) Trend Line' in 'Analytics Pane' then right-click on the worksheet tab and rename it 'ROC-Gap' (Figure 29).

Figure 29

Step 5. Drill-down Analysis

Drill-down is to go deeper into more specific layers of the data being analyzed. In this project, one example of drill-down is to explore data in industry sector level. According to Table 4, sector codes of retail are 44 and 45 and those of manufacturing are 31, 32, and 33.

Q17 Create a chart for ROC-Gap of Retail industry only. Duplicate 'ROC-Gap' worksheet and using Tableau 'Filter' card, extract only retail trade sector (Sector No. = 44, 45). Rename it as 'ROC-Gap-Retail' (Figure 32).

Figure 32 Drill-down to retail trade sector

Map Format Server Window → □ C C . C . 04 · @ 04 · 17 14 17 2.0. I # Fit Width 35 6 Analytics . Data Pages S&P500-Sector (Income. N AT + 44 Detail Tootip Path CEO 45 DT 48 = DVT -None Exclude GDWL 108 - 81 Sun NI = Field: [Sector] . Red Selection: Selected 2 of 20 values

Q18 Create a chart for ROC-Gap of manufacturing industry only. Duplicate 'ROC-Gap' worksheet and using Tableau 'Filter' card, extract only manufacturing sectors (Sector No. = 31, 32, 33). Rename it as 'ROC-Gap-MNF'. Comparing ROC-Gap charts, which industry shows a growing significant gap (Figure 33)?

Figure 33

Drill-down to manufacturing sector

		(T. T.	-,	
Data Analytics *	Pages			III Columns E YEAR(FY)
S&P500-Sector (Income				E Rows (AGG(ROC-Gap)
Dimensions Ⅲ P ▼ Abc CN	Filters			Filter [Sector]
E FY Abe NAICS	Secto			General Wildcard Condition Top
Abc S&P500 Abs SEC	Marks			Select from list Custom value list Use al
Abc Sector	∼ AL	itomatic		Enter search text
Abi: TS Abi: Measure Names	Color	() Size	T Label	
	oio Detai	□ Tooltip	∼⁄ Path	23 31 32 32
Measures				✓ 33 42 44
# AT				45
# CEQ				48
# DT # DVT				All None Exclude

Q19 Export 'ROC-Gap-MNF' and 'ROC-Gap-Retail' to Excel files and make one Excel line chart with polynomial trend lines. You need to combine the two downloaded files into one file to create a chart with data from both manufacturing and retail sectors. Copy the downloaded Excel files in the 'Income-Inequality-Student-Data' and right-click on the worksheet tab and rename it as 'ROC-Sector-Export'.

Q20 Make a dashboard with the four previous worksheets (ROC, ROC-Gap, ROC-Gap-MNF, ROC-Gap-Retail). Click 'New dashboard' icon and drag the four worksheets in the left pane to dashboard area.

Part 4. Technical Memo for Adoption of Tableau

Q21 Write a short e-mail to your CEO on why you need to adopt Tableau assuming your CEO requests a comparison between MS Excel and Tableau. List at least five advantages/disadvantages of Tableau compared with MS Excel, i.e, (1) Visualization, (2) Data Compatibility, (3) Training Efficiency, (4) Cost, and (5) Presentation. Make a new worksheet 'Memo' in 'Income-Inequality-Student-Data.xlsx'

Part 5. Submission

Before you submit your project files, save your Excel and Tableau files with your school student id, i.e., 'Income-Inequality-(Student-ID).xlsx" and 'Income-Inequality-(Student-ID).twbx'. You need to save your tableau file with an extension of "twbx" (Figure 34) The Tableau file with 'twbx' extension is a package of files with your data and your Tableau workbook files for sharing them with your instructor.

Figure 34

Save as twbx extension

Make sure to submit all 16 worksheets, as follows:

Six worksheets in the Tableau file:

- 1. Count
- 2. ROC
- 3. ROC-Gap
- 4. ROC-Gap-Retail
- 5. Roc-Gap-MNF
- 6. Dashboard

Ten worksheets in the Excel file:

- 1. Data
- 2. Count
- 3. S&P500
- 4. Data-S&P500
- 5. S&P500-Only
- 6. S&P500-Not-Null
- 7. S&P500-Sector
- 8. Sector
- 9. Export-ROC
- 10. Export-Sector-ROC
- 11. Memo
